

Identity at the
Speed of Life

IMID Mobile

Product Note

As much as technology is capable of replacing humans for certain tasks, there are roles that only humans can play, even when it comes to identification. Applications like school security, parking garage entry and even government office access, require a personal touch to ensure safety for those inside, and ease of movement for those who are authorized to enter. Certain roles are inherently limited, in terms of humans performing them without additional complementary help.

FST Biometrics has developed the perfect complement for security and other personnel needing to identify large populations and provide supplemental information about each recognized person. IMID Mobile is a smart mobile solution that offers FST's proven fusion of biometric technologies to provide seamless, non-invasive and accurate real-time identification, resulting in valuable additional information. It serves as an aide to professionals, ensuring correct visual identification at the speed of life.

IMID Mobile utilizes the IMID core technology, maximizing the effectiveness of the user and the system.

Applications

IMID Mobile is a smart solution for many settings, including schools, daycare centers, assisted living facilities, government offices, hospitals and government offices. Using FST's visual identification technology, IMID Mobile accurately and efficiently provides assistance to professionals, allowing them to more effectively perform their duties.

Schools/Daycare

IMID Mobile can help a school's security guard protect students from abduction by providing the guard with information on which children are allowed to leave with which parents. The guard simply uses the camera of his mobile device to capture an image of the parent. The IMID system then identifies the parent and sends photos to the guard of the children authorized to leave with the waiting parent, efficiently and safely.

Parking/Residential

IMID Mobile can also help a condominium's parking garage attendant know if the driver of a car is authorized to enter. It also provides the needed information to the guard of whether each of the other passengers in the car are allowed access and are related to the identified driver.

IMID Mobile

Product Note

Healthcare

IMID Mobile can also be the difference between life and death, as it concerns hospital patients. Imagine a scenario of a doctor visiting a patient in his bed, pointing his IMID Mobile-enabled device at the patient and immediately receiving valuable background information, such as patient condition and treatment, known allergies and pre-existing conditions.

Implementation

IMID Mobile is easy to install. Simply download the IMID Mobile app from Google Play, and the device connects with the facility's IMID server.

Once downloaded, the app accesses the device's camera and immediately provides valuable information to the user, allowing entry or exit for authorized individuals, while halting unauthorized or watch-listed people.

IMID Mobile automatically logs all information and provides via the IMID Access control center comprehensive reporting and analytical tools. This enables the creation of visitor records, restricted person entry attempts, and hourly usage and traffic.
